## Smart Energy Saver

Known as "vampire electronics" because of the way they suck power even when they're not in use, many peripheral devices in your home and office are bleeding your budget dry as well. When the SmartStrip detects that a main device, such as the plasma screen in a home theater setup, has been turned off, it automatically cuts power to that device's peripherals. As a result, the average home can trim as much as 113 kilowatts per month from its utility bill.
